PHPDL v2.2

Getting started

One file. A readable directory listing. No database.

1. Download and extract

Download the PHPDL v2.2 ZIP from https://www.dcsol.com/phpdl/ and extract index.php.

2. Drop it into each directory

Upload index.php into every directory you want PHPDL to list. Preserve any existing index.php before replacing it. PHPDL uses the files in its own directory.

3. Open the directory URL

Visit the directory in your browser. PHPDL displays filenames, file-type icons, sizes, modification ages, and download buttons.

Nested navigation

Place the same v2.2 file in both a parent directory and its child. The child displays ../ Parent Directory when it recognizes the signature in the immediate parent's index.php. No parent link appears at the collection root when its parent is not PHPDL.

Server requirements

Tested on PHP 8.5.12. PHP short_open_tag must be enabled. The web server needs readable files and traversable directories (typically 644 for files and 755 for directories). Configure index.php as a default document.

Public sharing

These demo documents are intentionally public. PHPDL does not provide authentication or make files private. Do not place confidential material in a public listing.
